Golf Injury Cheat Sheet

62% of amateurs will sustain a significant golf injury, typically because they are out of shape, have poor swing mechanics, or don't adequately warm-up. For the professionals that number is even higher at 85%, but their injuries tend to come from overuse ie. hitting 200 to 500 balls a day.

Here are some tips and changes you can address in your technique to reduce your injury risk.

Having a friend video your golf swing may be helpful, or a few lessons with a coach could keep you out of the injury bunker. The following cheat sheet assumes you are a right-handed golfer and therefore your lead arm/side is the left (the same principles would apply vice versa for left-handed golfers).

The Injury	The Problem	The Solution
Lead Wrist Hold your lead hand (left for right handed players) in front of you, thumb up, make a fist. There is a natural cup or angle at the back of the wrist – this is the power position for the joint.	 If left hand in a 'weak position' – thumb down the top of the handle - you risk a flat or bowed wrist on impact and possible injury Inadequate arm and wrist strength to lead the club through impact in this position Tend to over-extend and cock wrist for power, stressing the extensor tendons and overloading ligaments, especially if hitting the ground frequently 	 Rotate left hand away from the target about 30° from the weak position. So your thumb is at about 1 on an imaginary clock. This creates a slight cup in the wrist and a better power position
Lead Elbow	 Extensor tendons on outside of forearm are overloaded by jarring impact of poor stroke, mishitting ball and ground Results in muscle strain and tendonitis on the outside of the elbow called 'tennis elbow' Exacerbated by excessive tight gripping of the club 	 Avoid locking arm and elbow for more power. Keep it straight but relaxed, arms 'soft' from start to finish Momentum of downswing will pull the left arm straight This allows better absorption of impact forces and decreases load through tendons and ligaments
Trail Elbow	 Flexor tendons on the inside of the forearm are strained and overloaded by flexing and rotating the wrist during the impact and follow-through phase Strain results in tendonitis on the inside of elbow called 'golfer's elbow' 	 Power from the body not the wrists Avoid flicking (flexing) and cocking your wrist on and after impact.

The Injury	The Problem	The Solution
Lead Shoulder	 Keeping left arm too tight to the chest and straight during backswing and impact – overloads the joint with impact forces causing labral (cartilage) tears In backswing and follow through rotation from shoulders causes impingement and damage to AC (acromioclavicular) joint Rotator cuff muscle strain or tear when overloading them to power the swing 	 Keep arms loose and relaxed slightly forward/away from body Rotation comes from thoracic spine (upper body) NOT from shoulders Turn more with upper body, swing less with arms. Arms should 'follow' upper body rotation, not lead the rotation Improve upper spine (thoracic) mobility and shoulder joint flexibility through exercise Power from the body, not the shoulder or arm muscles
Lead Knee	 As you shift weight forward onto your left knee for swing through, all torque (rotational forces) and compression forces focused on inside of left knee Golfers often square the foot and lock knees – this increases shear forces on the knee, causing ligament strain and meniscus (cartilage) damage 	 The knee should shift in front of the hip very early on in the downswing Avoid having hips slide past the knee towards the target as this increases knee stress Focus on hips and pelvis rotating rather than sliding Line of left thigh should be vertical or leaning away from target on downswing Maintain a soft squat at the knees approximately 25° flexed Angle the left foot 20 or 30° outwards towards the target at address to promote hip rotation rather than sliding off loading the knee
Lower Back	 Power swing focuses on rotation of pelvis through swing Torque (rotational force) created through the pelvis and lumbar spine can overload and strain muscles, ligaments and tendons of lower back Control and conditioning of lower back critical for injury prevention Shearing effect can damage vertebral discs Avoid 'popping' after impact, arching your back overloads your spine 	 Power swing requires separation between rotation of the pelvis and trunk – greater separation means greater speed - this requires immense core strength and control to avoid injury Back strengthening exercises for core, pelvis, hamstring and glute muscles are crucial, as well as hip mobility exercises At address, hinge at the pelvis DON'T flex (slump) the lower back, this will increase load on your back Hips and spine must extend (straighten) together during the follow through Reduce injury risk by turning in unison – the hips and shoulders turn together on backswing and follow through – you sacrifice power but may save your back!
